Yuanbin Wu cs@ecnu

Announcement

- Project 1 due
 - 21:00, Oct. 9
- xv6 warm-up
 - target
 - install qemu
 - run xv6 in qemu
 - https://github.com/ecnu-oslab/ecnu-oslabup/blob/main/22-Fall/index.md#xv6-lab-environments

• Introduction of I/O operations

- Manipulate I/O
 - System call
 - File descriptor
 - No buffering

- Standard library
 - FILE object
 - Buffering

- Manipulate I/O
 - System call
 - File descriptor

- Standard library
 - FILE object
 - Buffer/non-buffer

- 5 basic system calls
 - open(), read(), write(), lseek(), close()
- I/O without buffering
- File sharing
 - understand file descriptor
 - dup() dup2()
- Other
 - fcntl(), sync(), fsync(), ioctl()

File Descriptor

• File descriptor

- Allocated when a process open a file
- "ID" of the file in the process (unsigned int)

• Default

- 0 (STDIN_FILENO): standard input
- 1 (STDOUT_FILENO): standard output
- 2 (STDERR_FILENO): standard error

• Open files:

```
# include <fcntl.h>
int open(const char *pathname, int o_flag, ... );
// man 2 open
```

- Return value
 - Success: file descriptor
 - Failed: -1
- o_flag:
 - O_RDONLY, O_WRONLY, O_RWWR
 - Options:
 - O_APPEND, O_CREAT, O_TRUNC, ...

- Open files
 - File descriptors: the smallest one available
 - Examples

```
int main (int argc, char **argv)
{
    int fd = open("foo", O_RDONLY);
    printf("%d", fd);
}
```

```
int main (int argc, char **argv)
{
    close(0);
    int fd = open("foo", O_RDONLY);
    printf("%d", fd);
}
```

- Open files
 - STDIN_FILENO, STDOUT_FILENO, STDERR_FILENO
 - opened by the OS when creating a process

Close files

```
# include <unistd.h>
int close(int filedes);
```

• Return

- Success: 0
- Failed: -1

• File Position

```
# include <unistd.h>
off_t lseek(int filedes, off_t offset, int whence);
```

- An offset (in byte) to the "whence" of the file
- whence:
 - SEEK_SET, SEEK_CUR, SEEK_END

• concept: "current file offset"

Read files

```
# include <unistd.h>
int read(int filedes, void *buf, size_t nbytes);
```

- Start reading at "file offset"
- Return:
 - Success: number of bytes read (0, if EOF)
 - Failed: -1
- Return < size
 - EOF
 - Read from terminal (stdin), one line

- ...

• Write files

```
# include <unistd.h>
int write(int filedes, const void *buf, size_t nbytes);
```

• Return:

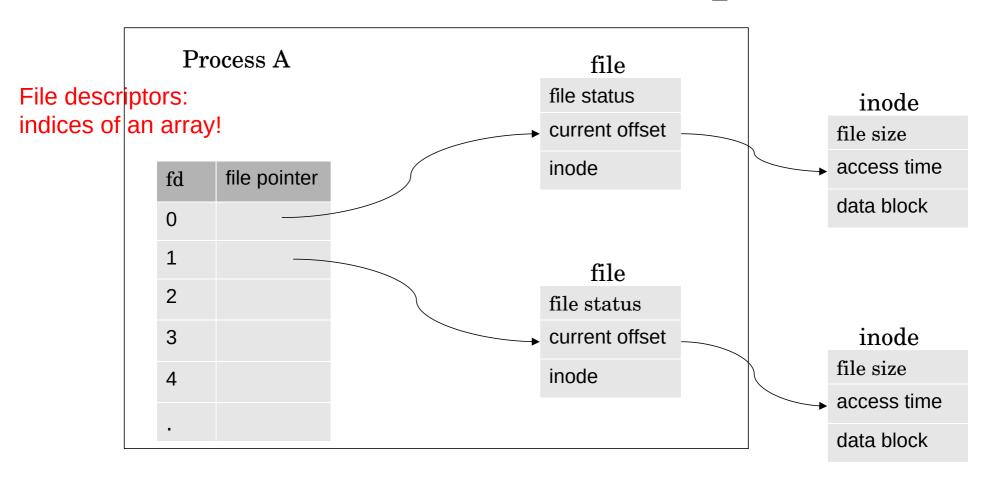

- Success: number of bytes write
- Failed: -1

An Example: I/O and Buffers

- I/O without buffer
 - No (user space) buffer
 - read(), write(): system calls
 - Do have buffer in kernel space (by file system)
 - Let's do some coding

- Buffering do matter!
 - printf, scanf in standard I/O library are buffered

Revisit File Descriptors

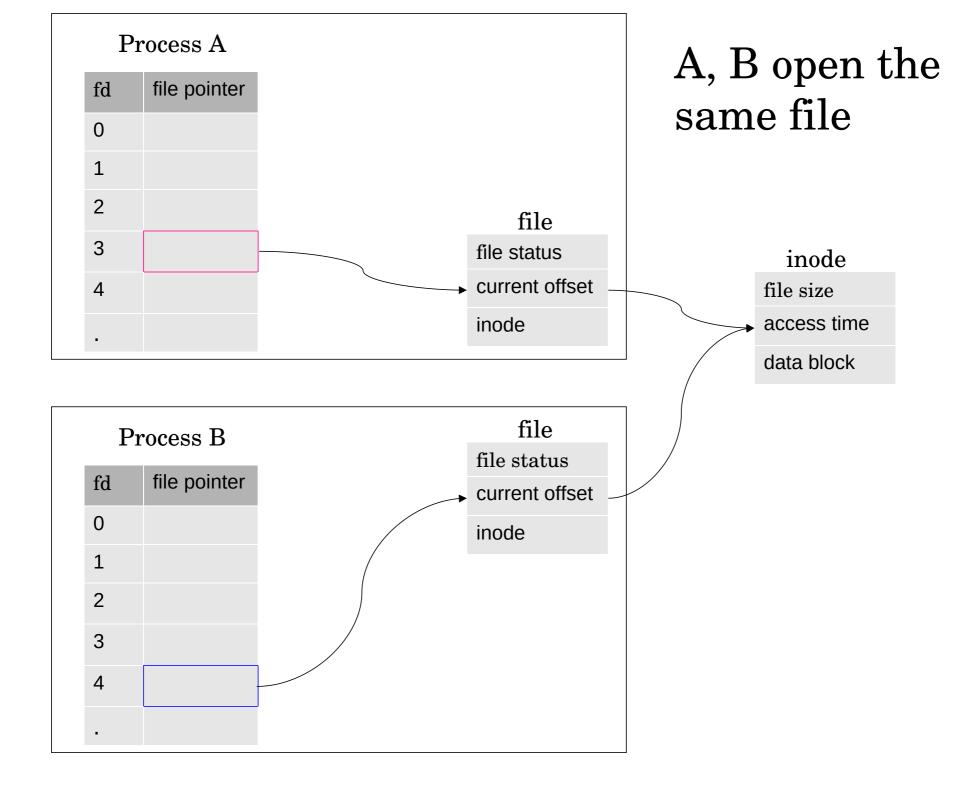

- 1. Each process has its own array of "struct file*"
- 2. Each file associates with only one "struct inode"
- 3. The "inode number" is a low-level id of a file

```
struct files_struct {
 int count;
 fd set close on exec;
 fd set open fds;
 struct file * fd[NR OPEN];
};
struct file {
 mode_t f_mode;
 loff_t f_pos;
 unsigned short f flags;
 unsigned short f_count;
 unsigned long f_reada, f_ramax, f_raend, f_ralen, f_rawin;
 struct file *f_next, *f_prev;
 int f owner;
 struct inode * f_inode;
 struct file_operations * f_op;
 unsigned long f version;
 void *private data;
struct ext2_inode {
    __u16 i_mode;
                        /* File type and access rights */
    u16 i uid;
                       /* Low 16 bits of Owner Uid */
    __u32 i_size;
                       /* Size in bytes */
                       /* Access time */
    u32 i atime;
    u32 i ctime;
                       /* Creation time */
    u32 i mtime;
                       /* Modification time */
    __u32 i_dtime;
                        /* Deletion Time */
    u16 i gid;
                       /* Low 16 bits of Group Id */
     __u16 i_links_count; /* Links count */
    __u32 i_blocks;
                       /* Blocks count */
    u32 i flags;
                       /* File flags */
    u32 i block[EXT2 N BLOCKS]; /* Pointers to blocks */
```

Quiz

• What happen when we open a file with a text editor?

• What happen when we open a file with two different text editors?

File Sharing

- Simple? ... emmm ...
- Example: how to implement
 - open("file", O_WRONLY | O_APPEND)
- Two process (A and B) run the same code, what will happen?

Atomic operations

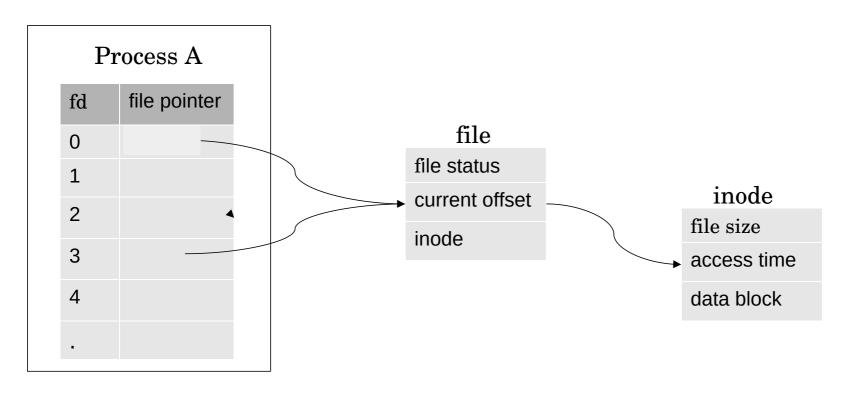

File Sharing

• Duplicate a file descriptor

```
# include <unistd.h>
int dup2(int fd, int fd2);
```

- set "fd2" point to the same file of "fd"
- Return
 - Success: fd
 - Failed: **-1**

// if fd 0 is open, close it first dup2(3, 0);

- 1. a file with multiple file descriptors
- 2. I/O redirection

- Other system calls
 - sync() / fsync():
 - "delay write"
 - Flush kernel buffer
 - fcntl(): change file (opened) attributes
 - ioctl(): other methods

- Summary
 - File descriptor
 - open, close, read, write, lseek, dup
 - File sharing

- Manipulate I/O
 - System call
 - File descriptor
 - No buffering

- Standard library
 - FILE object
 - Buffering

- #include <stdio.h>
 - FILE object (structure)
 - Buffering
 - Formatted I/O

System Calls vs Library Functions

• Recall:

```
#include <stdio.h>
void foo()
{
    printf("bar\n");
}

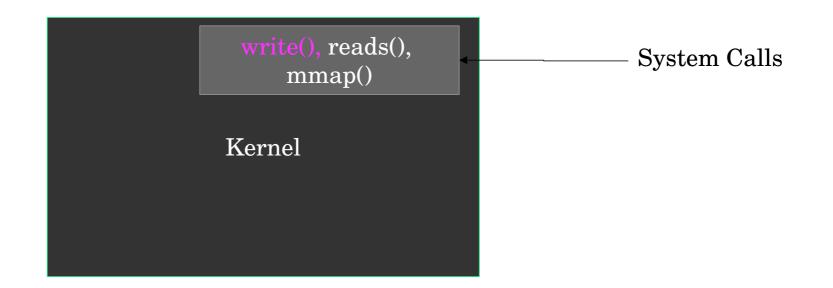

printf()
    fprintf()
    malloc()
    atoi()

#include <stdio.h>
User application

User application

User application

(Glibc)
```

```
# include <fcntl.h> # include <
int main (int argc, char **argv)
{
  int fd = open("foo", O_RDONLY);
}</pre>
FILE* fp
}
```

```
# include <stdio.h>
int main (int argc, char **argv)
{
   FILE* fp = fopen("foo", "r");
}
```

- Stream and FILE object
 - A wrapper of file descriptor
 - More information:
 - buffer
 - error info
 - single-byte or multi-byte

FILE Object

- Opaque pointer
 - The implementation is hidden
 - Access the struct member through functions
- Operations on FILE objects
 - Get file descriptor: fileno(FILE* f)
 - Set buffer: setbuf(FILE* f, char* buf)

- Buffering
 - stdio provide a "standard I/O buffer" (user space)
- Three types of buffering
 - Full buffered
 - Performs I/O when the buffer is full
 - Line buffered
 - Performs I/O when encounter a newline
 - Unbuffered
 - Performs I/O immediately, no buffer

- Three types of buffering
 - Standard error is unbuffered
 - A stream is line buffered if it refers to terminal device, otherwise full buffered

• Write "standard I/O buffer" to disc:

```
# include <stdio.h>
int fflush(FILE *fp);
```

Open/Close streams

```
# include <stdio.h>
FILE *fopen(const char* path, const char * type);
FILE *fdopen(int fd, const char * type);
int fclose(FILE* fp);
```

- Type: "r", "w", "a", "r+"...
- Return
 - Failed: NULL

• Character-at-a-time I/O

```
# include <stdio.h>
int getc(FILE *fp);
int fgetc(FILE *fp);
int putc(FILE *fp);
int fputc(FILE *fp);
```

• Line-at-a-time I/O

```
# include <stdio.h>
char* fgets(char *buf, int n, FILE *fp);
char* gets(char *buf);  // should never be used
int fputs(char *str, FILE *fp);
int puts(char *str);
```

• Direct I/O

```
# include <stdio.h>
size_t fread(void *ptr, size_t size, size_t, nobj, FILE *fp);
size_t fwrite(void *ptr, size_t size, size_t, nobj, FILE *fp);
```

- Standard I/O efficiency
 - Recall: buffering in system calls
 - Let's do some coding

- Formatted I/O
 - printf, fprintf, scanf

- Summary
- #include <stdio.h>
 - FILE object (structure)
 - Buffering
 - Formatted I/O

Introduction of I/O Operations

- Summary
 - System call
 - File descriptor
 - No buffering

- Standard library
 - FILE object
 - Buffering

Project 0b

- a simple key-value store
- with the standard I/O library

- Project 0 due
 - 21:00, Sep. 19
